

Compliance that survives the transfer.

Today, a restriction on a regulated asset is enforced by a person. TrustLogic makes it a **property of the asset**: re-encoded at every change of hands, durable through rule changes, and not stripped away when the asset moves.

A DIFFERENT QUESTION

Permissioned token standards address transfer compliance and provide powerful administrative controls. ERC-3643 provides agents with freeze, recovery, and forced-transfer powers. TrustLogic addresses a different question: **how does a continuing obligation stay represented and enforceable as economic rights move, rules change, and events occur between transfers?** It adds a separate, persistent authority relationship, so the obligation stays associated with the governed position rather than depending solely on a transaction check or later operator intervention.

WHAT PERSISTENCE MEANS

01

Survives the transfer

A transfer burns the outgoing position and mints a new governed position with the full rule set re-encoded at issuance. Nothing to strip, and no convention a marketplace can decline to honor.

02

Survives the rule change

Beneficiary rights reference the trustee relationship, not a token identifier. Governing rules can be amended, reminted, or overlaid, and every existing position stays valid under the new rules. No reissuance cycle.

03

Survives time

Because the rule lives in the asset rather than an operator's queue, it can be evaluated whenever the world changes (a sanctions listing, a lapsed accreditation, an expired milestone window), not only when someone initiates a trade.

The precedent is four centuries old. A trust can be amended without issuing new certificates to its beneficiaries. Their rights survive the amendment because the trustee relationship survives it. TrustLogic is that structure, executable.

WHERE IT STARTS TODAY: GOVERNED DRAW CONTROL

The issuer never receives unrestricted capital. Funds sit in a governed trust account, and every draw request is evaluated against approved vendors, budget lines, permitted categories, and milestone state **before money moves**. Blocked draws are logged with a reason. Overrides are permitted and permanently recorded with the reviewer's identity and rationale.

Why this first: it requires no data the customer does not already own, and it shows all three axes in a single flow. **Buyers:** Reg CF and Reg A funding portals, escrow and paying agents, project and construction lenders, donor-funded implementing agencies, platforms carrying delivery risk.

WORKS WITH, NOT AGAINST

TrustLogic is not a competing token standard. It works with ERC-3643 and institutional tokenization stacks, adding durability to restrictions those systems can already express. **The installed base is the distribution channel, not the competition.**
